needs to be*

New Octatron Product

Explosive Release Pole System

Designed for IED/Bomb/Ordnance disposal for precision charge placement

- Lightweight delivery system (approximately 5 lbs)
- Aluminum pole telescopes from 4'-16'
- Pull cord release of "package" from end of pole
- Hook on pole allows for carry and quick release of equipment
- Expendable plastic plates permit multiple uses of the ERP System

The ERP System

Using a telescoping, lightweight, aluminum pole, drop charges can be placed precisely where needed without placing the technician next to the suspect IED/ordnance.

At the tip of the pole is a latch release system that holds an expendable plastic plate to which a charge can be taped. This allows the charge to be placed precisely where needed, without leaving an antenna mast or camouflage tent pole susceptible to explosion. Pulling the release line separates the plastic plate and charge from the pole itself. The Explosive Release Pole System can be used repeatedly.

Using the attached carrying hook, the receiver/transmitter (for remote detonation) can be carried and gently set down before placing the charge on/near the object to be destroyed.
